LED HEADLIGHT ADAPTOR HARNESS KIT TO SUIT NEGATIVE SWITCHED VEHICLES

Barcode: 9342828239639

**TWIN PACK
LHS & RHS**

**SUITS 12V
APPLICATIONS**

Most aftermarket LED Headlights require a positive switched feed to activate the light. Because there are a few vehicles out there that switch earth instead of a positive this will cause the LED headlight to not activate. These Headlight Adaptor Harness Kits solve that problem by changing the earth to a positive supply.

Simply find a place to safely mount the relay harness using the tab on one side of the vehicle in the engine bay.

Earthing the ring terminal can be done at this point too. Ideally as close as possible to one of the LED headlights. Then very easily plug the female H4 connector of the harness into the new LED headlight and then Plug the Male H4 connector into the vehicles original H4 connector.

Repeat this process for the other light on the other side. Then you are ready to hit the road.
