

AND032 Marine Chev Alternator

JAS have contacted Insurance companies and confirmed some queries we have had from customers seeking Alternators with "Spark Arrestors" fitted.

The initial call we have had concerned being able to gain an insurance certificate for speed boats typically used for water skiing. Our customers had been told that their Alternators had to be fitted with spark arrestors to be insurable. AND032 is an Alternator that JAS now supply that has this feature fitted in the front and rear housings to prevent any potential sparks created in the alternator being able to escape it. AND032 is a Chev engine mount being one of the most common engines used in speed boat fitment and is single wire connected and self-exciting making for very simple and minimal wiring.

Metal mesh screen fitted to front & rear housing
