

SNB010

This type of “Pad Mount” Starter relies on the mounting bolts being a “tolerance” fit in the front housing to correctly position the drive in relation to the ring gear.

Please ensure the correct bolts are used, normally these can be seen with crosshatching on the shaft where they are a tight fit into the front housing.

Incorrect bolts can lead to Drive, Ring Gear and Drive End Housing damage.

This is not covered by manufacturer's warranty as it is not a manufacturing defect.

SNB010 is a Holden V8 aftermarket starter to suit “Red, Blue and Black” Holden non Injected 4.2 and 5.0 litre motors which replaces 2 original Bosch starters that were slightly different.

The original Bosch starters which are no longer available had 2 different solenoid positions and SNB010 has been designed to fit both applications by having its solenoid in a neutral position between the 2 original. This has been found to suit a majority of applications.
